

Core Paste XP

Core Build-Up Material

Core Paste® XP has the same strength and excellent handling characteristics of original Core Paste, with over 40 years of clinical success. The stackable viscosity allows you to build up without a matrix or core form, and the dual-cure formula gives you the confidence of a self-cure with the option of light-curing to speed the procedure.

Core Paste XP is a creamy, radiopaque paste developed specifically for high strength reliable core build-ups. When there is insufficient tooth structure available for a fixed prosthesis, CorePaste XP provides the added strength and stability needed for long-term clinical success.

- Dual-cure formula
- Stackable viscosity and excellent handling characteristics
- Cuts like dentin
- Radiopaque

Applications

- Core build-ups
- Integral post and core procedures
- Cementation of posts
- Esthetic posterior restorations

Before

After

Features	Benefits
Excellent handling characteristics	Stackable viscosity, syringes easily and cuts like dentin
Enamel and white shades	Enamel shade enhances the esthetics of translucent restorations White shade is easily distinguished from tooth structure
Fluoride release	Helps to prevent secondary decay
Auto-mixing syringe delivery	Eliminates hand mixing; less waste than cartridge/gun systems
Radiopaque	Easily distinguishable in radiographs

“I’ve been using Core Paste in my practice for many years. The stackable viscosity provides excellent handling properties. Core Paste is easy to use and consistently results in strong and effective restorations.”

— Ian Shuman, DDS, Pasadena, MD

Core Post Ideal for Core Build-Ups in Single-Tooth Restorations

Core Post Value Kit

#033637000

50 posts
Assorted sizes of carbon fiber
and glass fiber posts
